

ABSTRACT OF THE DISCLOSURE

METHOD FOR PRODUCING ORGANOALKOXYDIALKYLSILANE

The invention relates to producing an organo  
5 alcoxydialkylsilane by a method which consists in  
introducing by pouring an alkanol in a  
dialkylhalogenosilane omega-halogenalkyl + an organic  
solvent (s) phase mixture and in removing a halogen acid  
formed by entrainment with the aid of said organic  
10 solvent(s) phase and is characterised, in particular (i)  
by selecting a particular phase of solvent(s), for  
example based on cyclohexane, (2i) by carrying out an  
alkanol introduction mode which makes it possible to  
control the drawing off the halogen acid formed during  
15 reaction and by (3i) controlling the halogen acid  
quantity in a reaction medium. The thus obtained  
dialkylhalogenosilane omega-halogenalkyl is usable, in  
particular as an initial product for preparing  
organosilicic sulphur-containing compounds of general  
20 formula (IV) by a sulfidising reaction carried out on a  
alkali metal polysulfur.
